What We Are Doing A Pilot Project with BSA

The Eastern Connecticut Conservation District, Inc., a not-for-profit natural resource conservation organization, is partnering with the Boy Scouts of America and other organizations to install 100 rain gardens and 100 rain barrels in Eastern Connecticut. As part of the project, we are conducting workshops for the scouts and their local communities to educate them about nonpoint source pollution and methods to reduce it, such as with rain gardens.

To have a rain garden installed for free, contact Dan.Mullins@comcast.net; or call 860-319-8808.

WHY SHOULD YOU PLANT A RAIN GARDEN?

It's free! And, when you plant a rain garden, you help make the water in your neighborhood cleaner.

Each time it rains, rainwater flows over and through the ground, picking up contaminants that are left by our everyday activities – like lawn fertilizers and pesticides; oil, gas and heavy metals from our vehicles; viruses and bacteria in animal droppings; even sediment. Without intervention, these contaminants eventually find their way into nearby waterways, and ultimately Long Island Sound, where they can harm wildlife and make the water unsafe for swimming.

By planting a rain garden, you catch rainwater from areas in your yard where it can't soak in, like roofs, decks and driveways. By soaking rainwater into the soil, you protect the environment by keeping polluted rainwater out of our waterways – every time it rains!

How to Design and Install a Rain Garden:

1. Choose a location where water comes out of a gutter or directly off an impervious surface, such as a deck, driveway or sidewalk.
2. Measure the area of the roof, deck or driveway from which the water is draining. Then divide that area by 6 to determine how big your rain garden should be.
3. Test the soil to make sure rain water will soak in. Dig a small hole about 10-12 inches deep and fill it with water. The water should drain out within 24 hours. If it does not, you will want to select a different location.
4. Mark out the area with marking paint or a hose, and dig down into the ground about 8-10 inches, leaving the edges sloping towards the middle to create a shallow bowl shape.
5. Add compost to the bottom of the rain garden to help your plants grow.
6. Choose a variety of plants to go in the rain garden, including plants that will add interest throughout the seasons. Plants that are native to your area will require minimal attention once they are established and will attract pollinators and birds. Select plants that can tolerate temporary wet conditions or "wet feet" for the middle (deepest spot) of the rain garden.
7. Add 2-3 inches of mulch around the plants to suppress weeds and help protect the rain garden from erosion.
8. Water generously every few days until the plants are established.

Helpful Hint:

Avoid underground utilities – contact Call Before You Dig at 1-800-922-4455 or online at www.cbyd.com to locate underground utilities.
